

SAINT LUCIA: COASTAL ZONE MANAGEMENT STRATEGY - PHASE 1

The Caribbean island of St. Lucia has enjoyed considerable tourist-related development over the past 20 years. However, the economic and job-creation benefits have been “counter-balanced” by the associated problems of solid and liquid waste disposal and marine pollution related to cruise liner and yacht traffic. Government concern regarding impacts on the environmental quality of the coastal lands and waters led to the a series of studies to evaluate better coastal zone management.

Land & Sea Environmental Consultants Ltd. was retained to undertake a preliminary assessment of pollution and waste management in the more developed northwest coastal area. Using the study results, Land & Sea assisted in the development of policies to promote sustainable development and better coastal zone planning and development control.

Client: Atria Engineering Ltd. on behalf of the Government of Saint Lucia.
